IN THE SPECIFICATION

(ABSTRACT)

Please **REPLACE** the **ABSTRACT** of the application as filed with the following:

A system and method for capturing a displayed frame image from a computing device in a conferencing system is disclosed. A user selected area on the computing device is translated into boundary positions, those positions being configurable such that they may remain independent of the boundaries of the actual display or any window within the display. A frame image within the boundary is captured. The captured image may be transmitted to another computing device along with data associated with the captured image.
